UTCA Report Number 07305
December 15, 2008
The numbers of female and minority students enrolled in engineering schools are increasing slowly, however there is still a relatively small percentage drawn to the field of transportation civil engineering. As a consequence, there is a need to educate young people about the profession to encourage under-represented individuals to appreciate the contributions of engineers to society and encourage them to become civil engineers. This summer institute project consisted of bringing middle school students, after recommendations by their teachers, to the University of Alabama in Huntsville campus to learn about engineering as a career and experience a variety of transportation engineering design topics. The participants gained knowledge about the role of engineers in society as well as learned how engineers use their knowledge in design applications. An additional program was held this year in which the alumni were invited back for more advanced research in civil engineering projects. Several UAH faculty members and Society of Women Engineer professionals acted as team mentors. As an important part of this project, local minority and female engineers served as mentors for the program. This was the eighth year of the transportation summer program at UAH.

Executive Summary

The numbers of female and minority students enrolled in engineering schools are slowly increasing. However, there is still a relatively small percentage drawn to the field of transportation engineering. Consequently, there is a need to educate young people about the profession to encourage under-represented individuals to appreciate the contributions of engineers and encourage them to become civil engineers. This summer institute project consisted of two programs. The first was similar to previous years in which 20 middle school students were invited to the University of Alabama in Huntsville (UAH) campus to learn about engineering as a career and explore a variety of transportation engineering design topics. The participants gained knowledge about the role of engineers in society and how engineers use their knowledge in design applications. The second program involved inviting back 12 alumni from previous years to perform more in depth research in five areas of civil/transportation engineering. A technical paper was prepared and sent to ASCE for inclusion in an upcoming education conference.

Four UAH engineering faculty members, as well as professionals representing the Society of Women Engineer (SWE), NASA Marshall Space Flight Center, and National Society of Black Engineers, acted as instructors for the hands-on laboratories. As an important part of this project, several minority and female engineering students served as mentors for the program.
Section 1.0 Introduction

Problem Statement

Objectives

The numbers of female and minority students has been increasing overall in engineering and science (National Commission on Excellence in Education, 1983). However, there is still a relatively small percentage drawn to the field of civil and transportation engineering. Consequently, there is a need to educate young people about the profession to encourage under-represented individuals to become engineers and contribute to transportation technology.

Approach

The major goal of Gearing Up for Transportation Engineering Summer Program (GUTEP) was to introduce middle school students, with preference to under-represented groups, to basic engineering and transportation-related concepts. An additional approach of the project was to draft local minority and female engineers to act as team instructors and mentors. Participants used real world examples and new technologies in their hands-on activities to reinforce the concepts presented by the engineering mentors. A final comprehensive team project was used to tie all the knowledge together in a design competition.
Section 2.0 Background

Purpose

In past years, the University of Alabama in Huntsville (UAH) and the American Society of Civil Engineers (ASCE) worked with local schools in the Huntsville, Madison County, and Morgan County area and became aware that local public schools do not have any formal relationship with the engineering academic and technical community. In addition, all those school systems have a high ratio of minority students, approximately 25% of total enrollment. As a consequence, local county middle and “science magnet” school principals and teachers were asked to nominate students for GUTEP. Under-represented students, female and minorities, were given preference. This GUTEP project consisted of bringing selected middle school students to the UAH campus to learn about various aspects of engineering and explore transportation-related design and safety topics. A committee consisting of representatives from each of the participating groups selected these participants based on potential rather than classroom grades.

This year, an additional five days were dedicated to an alumni program for students who had participated previously in this UTCA program. These students were selected based on their interest and performance in the past. This opportunity may encourage them to consider civil and transportation engineering as a career option and increase diversity of the workforce, a problem in some areas of the country (US DOT, 2000).
Section 3.0 Methodology

Program Strategy

Recent efforts to reform science education in schools have led to the development of the Science/Technology/Society (STS) teaching method. Some important aspects of the STS method are that students must feel a concept is personally useful for solving specific problems, and students who learn through an experience will retain information and will be better able to apply the information later to new situations. Alabama has adopted a policy for effective instructional strategies to ensure that students are actively engaged in the learning process, have opportunities for interaction with the environment, and have time for reflection upon learning. Members of the Science State Course of Study Committee and Task Force support the use of inquiry-based instructional models such as the Five E Instructional Model shown below (Huntsville City School System, 2007). We have incorporated the following Alabama guidelines in the Gearing Up for Transportation Engineering Summer Program (GUTEP).

ENGAGE
Providing students with activities such as brainstorming; Know, Want to Know, Learned (KWL); and making simple observations to stimulate interest, evaluate and make connections between past and present learning, and identify prior misconceptions

EXPLORE
Allowing students to build upon prior knowledge through new experiences that incorporate active participation in a range of activities, including analysis, reflection, and data collection

EXPLAIN
Providing students with opportunities to construct meaning by verbalizing understanding of activities, making explanations, addressing questions, correcting misunderstandings, and introducing new science vocabulary

EXTEND
Offering students challenging opportunities to practice skills and extend understanding through research, projects, and presentations

EVALUATE
Having students reflect on their own learning in conjunction with teacher evaluations and self-assessment of understanding

In previous years, instructional and interactive experiences were developed with this grant to motivate interest in transportation engineering and related science topics. The program was initiated in the Gearing Up for Transportation Engineering Summer Program (GUTEP) in 2000. The current year’s program contains refined laboratory activities and initiated an alumni program to keep participants’ interest levels high.
The strategy of this program was to produce students who know “how to find out” and “how to examine and evaluate evidence.” As discussed in the first year’s UTCA final report (Leonard, et al., 2000), the following criteria were used in designing the hands-on experiments:

- The activities were designed so that the students could complete them by themselves; not demonstrations performed by the instructors for the class.
- The students had to be able to read, perform and document the experiments themselves with limited adult supervision.
- Each experiment was designed such that the results were sufficiently dramatic to keep the student's attention with a high probability of success.
- Experience has shown that middle school students work best in teams, so the activities and equipment were appropriately structured.
- In general, each experiment took approximately 1-1.5 hour including set-up and clean-up, and follow-up discussions were held to highlight concepts and results.
- Safety and good lab protocol were practiced and stressed throughout.

To accomplish these goals, students were encouraged to use the following design heuristic in their team transportation problem:

1. Define the problem
2. Generate possible solutions, using brainstorming and other creative thinking techniques
3. Decide on a course of action
4. Integrate the solution
5. Evaluate the solution

This project meets UTCA goals of increasing diversity in the transportation field, and thus affects Alabama’s future human resource population by using technology transfer through focused educational activities.
Section 4.0 Project Results

Tasks Completed

This project had a one-year duration commencing January 2007. The following tasks were completed to achieve the desired goal of transportation education through technology transfer.

Recruiting
Sent out letters to schools, made phone calls to science teachers and made follow-up contacts. Dr. Leonard made site visits to several middle schools to meet with science and math teachers for additional recruiting. The program committee got together to select 20 students for the initial GUTEP week and an additional 12 students for the alumni program based on potential and interest levels.

Schedule Mentors
The principal investigator contacted professional organizations (National Society of Black Engineers, Society Women Engineers, American Society of Civil Engineers), college chapters of the societies, NASA Marshall Space Flight Centers, local companies (SEI Group, Boeing and Sverdrup), and Huntsville Center of US Army Corps of Engineers.

Set-Up Schedule and Lab Experience

- The principal investigator met several times with instructors to discuss objectives of each lab experience.
- Professors were asked to update individual experiments as indicated by last year’s survey results.
- Instructors developed six hour labs for the alumni program: GPS and Surveying (Dr. Anderson), Geotech (Dr. Schwarz), Robotics (Mr. Edgar Blevins - ISE), Composite Materials (Dr. Toutanji) and Solar Power (Dr. Leonard).
- Ran through labs with several middle school students prior to GUTEP.
- Finalized laboratory instructions from Co-PIs.
- Obtained supplies and collated student manuals.
- Scheduled rooms on campus and field trips.

GUTEP (Week 1: June 11-15, 2007)

- Divided students into five teams of four students to run concurrently in labs.
- Followed schedule. (See Appendix A.).
- On Friday of each week participants gave demonstrations and oral reports on their team’s future transportation design to parents and instructors.
**GUTEP Alumni Institute** (June 11-15, 2007)

- Each instructor took student teams for a day and performed more in-depth projects requiring problem solving skills.
- Each day ended with a team discussion on topics learned and how they may be applied to transportation engineering.

**Post-Program Activities**

- Thank you letters and certificates were sent to instructors and field trip sponsors.
- Compiled participant surveys.
- Instructors met to discuss ways to improve program for subsequent years.
- Proposal was submitted for 2006 UTCA funding.

**Deliverables**

- Completed manual for students and as a teacher resource – All five investigators were responsible for completing their laboratory experiments.
- The manual was posted on the UAH UTCA web site in html format (http://coeweb.eb.uah.edu/cee/utca.htm).
- Principal investigator was responsible for quarterly reports to UTCA. The draft final report was completed and sent to UTCA in 2008.
- Technology Transfer: An abstract was submitted by the principal investigator that was accepted for the ASCE-EWRI National Conference to be held in summer of 2008.

**Synopsis of Curriculum**

**Topic One - Traffic Simulation**

**Objective:** To learn about the traffic engineering concept, level-of-service, and how traffic engineers use micro-simulation to analyze roadway intersections and design city streets.

**Description:** In this activity, students explore traffic micro-simulation and determine existing and future levels of service for different roadways systems. The students will learn about highway design principles related to intersections and traffic signal control.

**Topic Two - Space Transportation**

**Objective:** To demonstrate how rocket lift-off is an application of Newton's Laws of Motion. Students also will learn about the history and future of space transportation in the USA (NASA, 2000).

**Description:** To demonstrate how rocket liftoff is an application of Newton's Laws of Motion. Students construct a rocket powered by the pressure generated from an effervescing antacid tablet reacting with water. Students also use the NASA disk "Space Transportation: Past, Present and Future" to learn about space applications.
**Topic Three - Construction Materials**
Objective: To learn about different types of materials used for roads, bridges, parking lots, dams, and buildings.
Description: In this activity, students learn about engineering materials used in transportation, such as wood, metals, concrete, pavements and composite materials. They will prepare and test some of these materials.

**Topic Four - Engineering Shapes**
Objective: To learn how to enhance the strength and stability of simple structures.
Description: In this activity, students will build and test a column, dome and truss and make predictions on loads.

**Topic Five - Alternative Energy**
Objective: To explore alternative energy sources, other than fossil fuels, for future transportation modes. Also, to stress the importance and effectiveness of alternative energy sources.
Description: In this activity, students perform experiments using a solar cell. They will observe the physical power of light/heat absorption through a small free moving device with black and white panels. Each student will construct a battery powered fan boat.

**Topic Six - Bridges**
Objective: To learn about different types of bridges by building simple models.
Description: In this activity, students construct a simple span bridge. They will use an interactive computer simulation model to design a suspension bridge to carry the load of a truck. They will also build a scale model of their bridge design.

**Topic Seven - Geotechnical Materials (Mud Pie Magic)**
Objective: To understand the principles of soil compaction and the behavior of layered soil systems when supporting a dynamically applied load.
Description: Students will perform simple experiments in the UAH Soil Mechanics Laboratory to demonstrate the behavior of a layered soil system and load carrying ability of the system for dynamic loadings similar to wheel loads imposed by traffic.

**Topic Eight - Transportation Safety**
Objective: To explore issues related to automobile safety and to explore alternatives that would design safety into cars.
Description: In this activity, students learn about bike, bus and auto restraints safety. They also perform experiments illustrating passive and active safety features using eggs.

**Topic Nine - Robotic Car**
Objective: To learn about new technology that can be adapted to transportation to increase safety and performance.
Description: Each team of two students will build, program and test a robotic automobile.

**Topic Ten - Future Transportation Design Problem**
Objective: To design and build a working model of the team's vision of a future transportation vehicle.
Description: In this activity, students design a prototype of a vehicle of the future. They construct a working model with motorized K'nex kit to meet energy, safety, and infrastructure constraints. The team prepares a presentation for the class and parents of the last afternoon that illustrates their objectives, approach and selection of a future vehicle.

Goals Met

The major goal of this program was to introduce middle school students with preference to under-represented groups, to basic scientific and engineering concepts. These groups have potential for science and engineering, but might lack role models and motivation to pursue a career in transportation engineering. The selection committee used the teacher references to rate the students (criteria were student statements of interest, teacher comments and ethnicity). Through the UTCA summer program, we were successful in recruiting 60% minority students (African American, Asian, and Hispanic) and 80% female students for the first week. The alumni program was 92% female with 67% ethnic minority students for the program. The ethnicity and gender breakdown is given in Table 4-1.

Significance and Benefits of the Program to Participants

The participants gained knowledge about the role of transportation planning, management, safety, and design in modern society. The emphasis was on how engineers use their knowledge in design applications. The last day of the Summer Institute concentrated on the team design in transportation engineering, where they combined the knowledge acquired in the laboratory experiences. A faulty member or professional acted as each team’s mentor and helped them to prepare an electronic and oral presentation of their design. Students in the winning design team were awarded certificates of accomplishment and gifts at the closing ceremony on Friday.
the students received a prize of some kind, from the safety challenge, bridge design, rocket launch, etc., which helped to instill a sense of accomplishment and pride.

Since the middle school curriculum contains hard science and algebra, which are directly related to engineering, this program enhanced classroom instruction with hands-on experience. In addition, the principal investigators and professionals that acted as team mentors also functioned as role models for minority and female students. This may help to increase the numbers of these students who will become transportation professionals. The use of UAH minority and women engineering students as lab assistants encouraged them to become involved in the community as professionals.

The program was intended to be a fun learning experience with a lot of basic information, team building skills, and hands-on laboratory experience of the latest transportation safety and management technology. On the last afternoon of the program, the students were asked to complete a program survey course. Table 4-2 shows the results. The favorite experiments were concrete bowling (materials) and bridges (design and build Popsicle stick bridge). These will remain unchanged in the upcoming program. The least favorite, space transportation will be updated with more fun, dynamic activities. The students were also asked about their enjoyment of the program and most of them answered affirmatively to questions regarding recommending this program to a friend and the fact that the field trips and experiments increased their knowledge of engineering (question #6). The last question indicates their own views about engineering as a future career for them. Approximately 90% thought that they might choose engineering as a profession.

Advantages for Participants

- fun and enjoyable exposure to science, engineering and transportation technology topics
- development of thinking and problem-solving skills
- learn what civil engineers do and their contributions to society
- meaningful and immediate experimental learning
- fuel for their natural curiosity
- self-directed learning opportunities in team design
- increased self-esteem from completion of institute
- multiple exposure to difficult topics and inter-relationships to transportation issues
- opportunity to learn within academic facilities – may take away fear of technology
- diversity of mentors help students feel comfortable at institute

Five Year Follow up Survey Results

Since this proposal is the commencement of sixth year for this UTCA project we have an alumni-base of over 180 students, with some at college entry age. A survey of the alumni from the first two years was conducted to determine if the past participants have entered engineering or science studies to quantify the impacts of this program in north Alabama. Although the return rate on the surveys was low (60 surveys were mailed, but only nine were returned) due to the lack of current addresses, some general conclusions can be made about the program. For example, 89% of the respondents were planning on going to college, and the majority was going to study engineering (5/9). Of these five students, two females were planning on studying civil engineering. Question #7 asked about the role that the GUTEP played in their decision, and the majority did respond that it did. Although we do not have a general statistic from this age and demographic population, it seems that our numbers show success in that most of these students are going to college (they would be first generation college graduates) and the majority are going into a technical field (Leonard, 2008).

UAH Student Involvement

The project employed four undergraduate student assistants and one graduate student (all minorities and/or females) to help in designing the projects, documenting plans, laboratory set-ups, and assist with the participating middle-school students at the Institute. Two female high school students who completed both of the programs, volunteered to help as mentors this year. Both were planning on entering college as engineering majors. Other university students acted as laboratory volunteers through the Society of Women Engineers, American Society of Civil Engineers and National Society of Black Engineers student chapters.
Section 5.0 Project Conclusions

Education and Technology Transfer Activities

The team members completed the lab activities' manual (both teacher instruction and student activity guides) for implementation at school visits and for next year's program. A web page was posted through UAH - UTCA home pages to allow on-line access. An abstract was written by the PI for the upcoming 2008 ASCE-EWRI Annual Conference, in the “engineering education” division. The title is “Gearing Up for Civil Engineering: Review of a Summer Institute for Increasing Under-Represented Students to Civil & Environmental Engineering.” It was recently accepted for a presentation and publication in the conference proceedings.

Research Relevance and Impacts to Alabama

This project addressed the mission and several major goals of the UTCA. In addition to providing educational experiences for minority students within Alabama, the project focused on diversity issues. This program has the potential to affect the future workplace (human resources issues) since the students may wish to become involved in working on transportation-related safety research at an early age and thus may gravitate towards the profession as they mature. The project also addresses the technology transfer goal of the UTCA since student assistants, mentors and participants were exposed to state of the art technology within the university curriculum.

After the program was finished the students completed a survey and all thought that the program was fun and educational. Most of them did not know what transportation engineers did prior to coming to UAH and were surprised at all the variations. Finally, they would all recommend the program to their friends.

Recommendations for Next Program

The survey results will be helpful in composing next year’s summer program. The least favorite lab will be updated with new material. The new activity, “CE challenge,” which was held in the fall for local high school freshman, will be continued next year to increase the number of students included in this venture.
